NOTE

- One load is 25% to 100% load, the other load is 100% load, the output voltage variable rate is within ±5%.
- Ripple/Noise measured with a 10µF electrolytic capacitor and 0.1µF ceramic capacitor.
- Test by minimal Vin and constant resistive load.
- Test by normal Vin and 100%-25% load, 25% load step change.
- Measured Input reflected ripple current with a simulated source inductance of 27µH and a source capacitor Cin(47µF, ESR<1.0Ω at 100KHz).
- "Nature Convection" is usually about 30-65 LFM but is not equal to still air (0 LFM).
- Exceeding the absolute ratings of the unit could cause damage. It's not allowed for continuous operating ratings.
- Input filter components are required to help meet conducted emission and radiated emission class A, which application refer to the EMI filter of design & feature configuration.
- An external filter capacitor is required if the module has to meet IEC61000-4-4 and IEC61000-4-5. The filter capacitor SCHMID-M suggest: Nippon - chemi - con KY series, 220µF/100V.

TEST CONFIGURATIONS

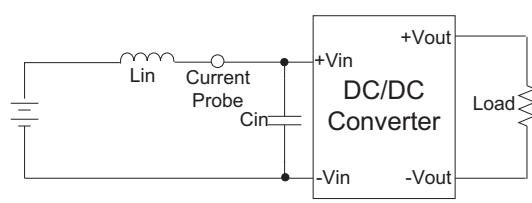

Output Ripple & Noise Measurement Test

Use a $10\mu\text{F}$ electrolytic capacitor and $0.1\mu\text{F}$ ceramic capacitor.
The Scope measurement bandwidth is 20MHz.

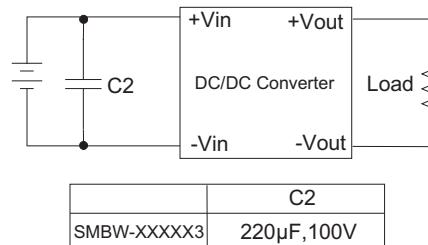

Input Reflected Ripple Current Test Step

Input reflected ripple current is measured through a source inductor $\text{Lin}(27\mu\text{H})$ and a source capacitor $\text{Cin}(47\mu\text{F}$, ESR<1.0Ω at 100KHz) at nominal input and full load.

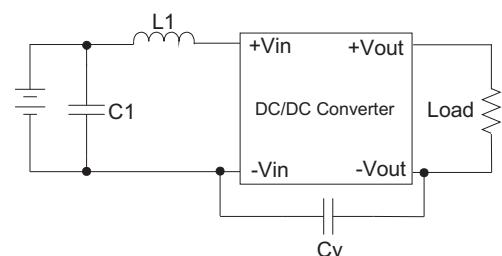

EFT/Surge Filter

Input filter components (C2) is used to help meet IEC61000-4-4 and IEC61000-4-5 .

EMI Filter(Conducted Emissions)

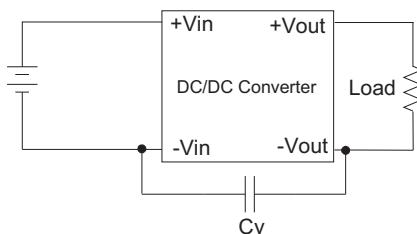

Input filter components (C1,Cy,L1) are used to meet EMI test criterial A. These components should be mounted as close as possible to the module; and all leads should be minimized to decrease radiated noise.
